

7 WAYS YOUR BUSINESS CAN REDUCE OR OFFSET CARBON EMISSIONS

CARBON OFFSET

Your business can reduce its environmental impact by offsetting carbon emissions through investing in the UK's forestry.

The Logical Carbon Offsetting Scheme can help you do this by planting an oak tree for every meter that's arranged into a contract.

TEMPERATURE CONTROL

Reduce heating and cooling expenditure by switching off heating units in the warmer months and air con units in the cooler months. Set timers and control your thermostat to comfortable working temperatures avoiding over-exertion of your heating and cooling systems.

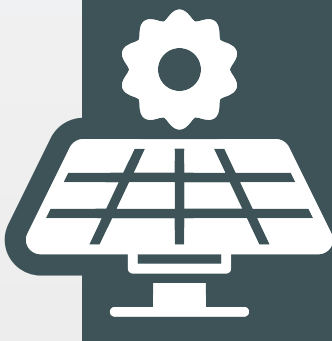

SOLAR PANELS

Producing your own energy can help keep bills down and cut your business' carbon footprint.

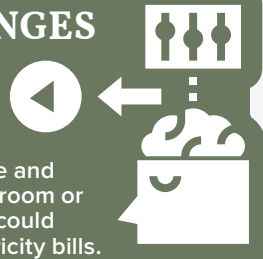

Solar photovoltaic panels – which need only daylight, not sunlight to generate electricity – work on buildings of all sizes.

BEHAVIOUR CHANGES

There are a number of ways you can work with your staff to ensure less energy is used in the workplace. By turn off monitors when they're not in use and switch off lights when leaving a room or install motion sensitive lighting could save your organisation on electricity bills.

RECYCLING

Businesses produce a lot of waste and as much of it as possible should be recycled. A great place to start is by providing recycling bins for glass, metal, paper and food waste, which will encourage a more diligent approach to waste management across your business.

GREEN ENERGY

Green energy contracts could ensure your business keeps up with government plans for a net zero future by offsetting your carbon emissions for you. Your energy supplier will either match the amount of energy you use with renewable sources, or they will donate a set amount to environmentally friendly projects.

ADVANCED MONITORING SYSTEMS

Advanced energy monitoring equipment can help your organisation observe power usage across your entire portfolio. Improving operational efficiency and keeping track of your energy consumption can give you what's needed for a competitive edge.

EnergyPulse™ can help you do this by giving you complete visibility of your energy usage. The system works by letting you see exactly how your business uses energy.
